

AdaOS

Verify the authenticity
of your documents

Oberthur Solutions has developed the AdaOS application to help you tackle fraud, facilitate control and verify the authenticity of your documents after they have been personalised.

AdaOS enables you to verify that the document you are looking at, if it is in your document database, has not been altered and that its content is authentic.

PART I - INTEGRATION

It is possible to integrate documents after personalisation from a scanner connected to a computer or from a prototype taken with your smartphone. To do this, connect to the web application and import the document or image.

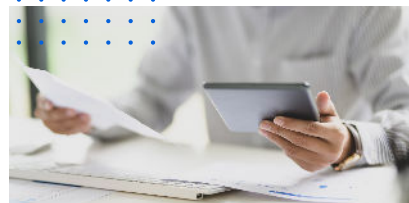

PART II - HOW TO USE ADAOS

1

PHOTOGRAPH

2

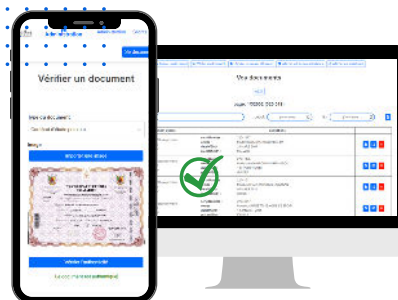

COMPARE

AdaOS automatically compares the document presented with your database.

To verify whether a document is authentic, it must be compared with its original. If the document has not been registered in advance, the application responds that the document has not been authenticated.

3

VERIFY

Your data is only accessible from the application, and is protected by redundancy and daily backups.
